

Geothermal:

Geothermal heating and cooling works by using groundwater, which remains at a temperature of approximately 55 degrees year-round, to help heat your home or business during the cold months and to help cool your home or business during the warm months. There are many factors that need to be assessed to assure that a geothermal system will supply the expected results at your location. A site assessment and planning meetings with your geothermal expert are essential in order to assure that the geothermal system will meet the needs and expectations of each customer.
