

Solar Pool Heating:

Solar pool heating is one of the most cost effective ways to use the power of the sun. In most instances, an existing pool pump can move the pool water up through the solar pool heating collectors. The water gets pumped from the bottom of the collectors to a return pipe at the top. The heated water then gets returned to the pool. Drawing the water from the drain at the bottom of the pool will assure that the pool will heat to a uniform temperature.

A solar pool heating system can pay for itself in a few years. Whenever the pool filtration system is on a solar pool heating system can be heating the pool with no additional emissions of green house gases.
