

**Wind Power:**

Wind turbines can generate electricity to be used directly by items such as pumps, or it can be used to power your home similar to the way PV systems do. Turbines are used in a variety of applications, including residential and commercial, both on land and water.

There are many factors that go into determining if a particular site is suitable for a wind power installation. It is important to have an expert who can analyze individual locations, assess tower height, review town regulations and determine if wind power is right for your needs.
